## A. Background on Properties of Frechet Distribution

This section provides a brief review of properties of Frechet distribution that are useful for proving main proposition in the main text.

Definition: A cumulative distribution function, $F$, is a single-variable $\operatorname{Frechet}(\theta, s, m)$ distribution if

$$
F(x)=\exp \left[-\left(\frac{x-m}{s}\right)^{-\theta}\right]
$$

where $\theta, s$, and $m$ are shape, scale, and location parameters, respectively.
Definition: The gamma function $\Gamma(\cdot)$ is defined as

$$
\Gamma(n)=\int_{0}^{\infty} x^{n-1} e^{-x} d x
$$

Remark: If $X$ is distributed as $\operatorname{Frechet}(\theta, 1,0)$, then

$$
E[X]=\left\{\begin{array}{cc}
\Gamma(1-1 / \theta) & \theta>1 \\
\infty & 0<\theta \leq 1
\end{array}\right.
$$

Definition: A cumulative distribution function $F$ is a multi-variate Frechet $(N, \theta)$ distribution (with scale 1 and location 0 ) if

$$
F\left(x_{1}, x_{2}, \ldots, x_{N}\right)=\exp \left[-\sum_{i=1}^{N} x_{i}^{-\theta}\right]
$$

Remark: A multi-variate Frechet is the joint distribution of N independent draws from singlevariable Frechet with same shape parameter.

Remark: If $\left\{X_{1}, X_{2}, \ldots, X_{N}\right\}$ are $N$ independent draws from a $\operatorname{Frechet}(\theta, s, m)$ and $X^{*}$ is the max of $\left\{X_{1}, X_{2}, \ldots, X_{N}\right\}$, then $X^{*}$ is distributed as $\operatorname{Frechet}\left(\theta, \mathrm{N}^{1 / \theta} s, m\right)$.

## B. Results for General Model with Multiple Sectors and Groups ( $\mathbf{G} \boldsymbol{>} 1$ and $M>1$ )

## B.1. Probability of Choosing Sector $s$

The probability of individual $i$ in group $g$ choosing sector $s$ is given by

$$
\begin{aligned}
P_{i g s} & =\operatorname{Pr}\left[\log \left(w_{s} e_{i s} z_{g s}\right) \geq \log \left(w_{m} e_{i m} z_{g m}\right) \forall m\right] \\
& =\operatorname{Pr}\left[\frac{w_{s} z_{g s}}{w_{m} z_{g m}} e_{i s} \geq e_{i m} \forall m\right]
\end{aligned}
$$

Using property of Frechet distributions above, we can derive following expression:

$$
P_{g s}=\frac{\left(w_{s} Z_{g s}\right)^{\theta}}{\sum_{m=0}^{M}\left(w_{m} z_{g m}\right)^{\theta}}
$$

This is the same formula for all sectors including non-work sector ( $s=0$ ).

## B.2. Conditional expected value of efficiency terms

The expected value of efficiency term given wages is given by

$$
E\left[e_{i g s} \mid \text { choosing } s\right]=\frac{\left(\sum_{m=0}^{M}\left(w_{m} z_{g m}\right)^{\theta}\right)^{1 / \theta}}{w_{s} z_{g s}} * \Gamma(1-1 / \theta)
$$

## B.3. Labor Supply

Total labor supply into sector is given by the following:

$$
H_{s}^{\text {supply }}=\sum_{g=1}^{G} H_{g s}^{\text {supply }}
$$

The labor supply for sector s from group $g$ depends on share of unit measure of individuals in group $g$ multiplied by probability sector s is selected among the individuals in that group and multipled by the (conditional) expected value of efficiency term for this group choosing sector s in group g). This is given by the following expression:

$$
H_{g s}^{\text {supply }}=q_{g} * P_{g s} * E\left[e_{i g s} \mid \text { choosing } s\right]
$$

## B.4. Labor Demand

The aggregate production function is given by following CES function:

$$
Y\left(H_{1}, H_{2}, \ldots, H_{M}\right)=\left[\sum_{m=1}^{M}\left(A_{m} H_{m}\right)^{\frac{\sigma-1}{\sigma}}\right]^{\frac{\sigma}{\sigma-1}}
$$

The total efficiency units of labor supplied to sector is given by

$$
H_{m}=\sum_{g=1}^{G} H_{g m}
$$

By taking first-order condition in each sector, we have following equation for labor demand:

$$
H_{m}^{\text {demand }}=Y\left(\frac{A_{s}^{\frac{\sigma-1}{\sigma}}}{w_{s}}\right)^{\sigma}
$$

Imposing zero profit condition gives following expression relating wages and (exogenous) sector-specific shifters:

$$
1=\sum_{m=1}^{M}\left(\frac{A_{m}}{w_{m}}\right)^{\sigma-1}
$$

Normalizing $w_{0}=1$, we have equilibrium wages given by following expressions, which are derived by setting labor demand equal to labor supply for each sector $s=1, \ldots, M$ :

$$
\Gamma(1-1 / \theta) * \sum_{g=1}^{G}\left(q_{g}\left(w_{s} z_{g s}\right)^{\theta-1}\left(\sum_{m=0}^{M}\left(w_{m} z_{g m}\right)^{\theta}\right)^{(1 / \theta)-1}\right)=Y\left(\frac{A_{s}^{\frac{\sigma-1}{\sigma}}}{w_{s}}\right)^{\sigma}
$$

Proposition: The ratio of averages wages across sectors is not affected by sector-specific shifters, meaning that average wages in all sectors decline by the same proportion for each demographic group in response to any combination of sectoral shocks.

## Proof:

Take ratio of average wages for any group $g$ in any two sectors $s$ and $t$ :

$$
\begin{aligned}
& \frac{w_{s} E\left[e_{i g s} \mid \text { choosing } s\right]}{w_{t} E\left[e_{i g t} \mid \text { choosing } t\right]}=\frac{w_{s} \frac{\left(\sum_{m=0}^{M}\left(w_{m} z_{g m}\right)^{\theta}\right)^{1 / \theta}}{w_{s} z_{g s}} * \Gamma(1-1 / \theta)}{\left(\sum_{m=0}^{M}\left(w_{m} z_{g m}\right)^{\theta}\right)^{1 / \theta}} \\
& w_{t} z_{g t}
\end{aligned} \Gamma(1-1 / \theta),
$$

## C. Proof of Proposition in Main Text (for $G=1$ )

Proposition: In the case with a single group $(G=1)$ and arbitrary number of sectors $(M>1)$, a negative shock to sector $m$ (i.e., a reduction in $A_{m}$ ) reduces employment and average wages in
sector $m$ and increases the share of the population in the non-work sector and in the other work sectors. The ratio of averages wages across sectors is not affected by the shock, meaning that average wages in all sectors decline by the same proportion in response to any combination of sectoral shocks.

## Proof:

The last part of the proportion is true in general case where $G \geq 1$, so it is implied by result above. To prove the remainder of proposition, we first derive result for ratio of wage (per efficiency unit) in each combination of sectors $s$ and $t$. To do this, we start with equilibrium condition for sector s when there is a single group ( $G=1$ ):

$$
\left(w_{s} z_{g s}\right)^{\theta-1} \cdot\left(\sum_{m=0}^{M}\left(w_{m} z_{g m}\right)^{\theta}\right)^{\frac{1-\theta}{\theta}} \cdot \Gamma\left(1-\frac{1}{\theta}\right)=Y \cdot\left(\frac{A_{s}^{\frac{\sigma-1}{\sigma}}}{w_{s}}\right)^{\sigma}
$$

Next, we take ratio across sectors $s$ and $t$ :

$$
\begin{aligned}
& \left(\frac{w_{s} z_{g s}}{w_{t} z_{g t}}\right)^{\theta-1}=\left(\left(\frac{A_{s}}{A_{t}}\right)^{\frac{\sigma-1}{\sigma}} \cdot \frac{w_{t}}{w_{s}}\right)^{\sigma} \\
& \frac{w_{s}}{w_{t}}=\left(\frac{A_{s}}{A_{t}}\right)^{\frac{\sigma-1}{\theta+\sigma-1}} \cdot\left(\frac{z_{g t}}{z_{g s}}\right)^{\frac{\theta-1}{\theta+\sigma-1}}
\end{aligned}
$$

We next use the zero-profit condition to derive closed-form expression for $w_{s}$ :

$$
w_{s}=A_{s}^{\frac{\sigma-1}{\theta+\sigma-1}} Z_{s}^{-\frac{\theta-1}{\theta+\sigma-1}}\left[\sum_{m=1}^{M} A_{m}^{\frac{\theta(\sigma-1)}{\theta+\sigma-1}} z_{m}^{\frac{(\theta-1)(\sigma-1)}{\theta+\sigma-1}}\right]^{\frac{1}{\sigma-1}}
$$

From this expression we can then solve for $P_{s}$

$$
P_{s}=\frac{A_{s}^{\frac{\theta(\sigma-1)}{\theta+\sigma-1}} z_{s}^{\frac{\theta \sigma}{\theta+\sigma-1}}}{z_{0}^{\theta}+\sum_{m=1}^{M} A_{m}^{\frac{\theta(\sigma-1)}{\theta+\sigma-1}} z_{m}^{\frac{\theta \sigma}{\theta+\sigma-1}}}
$$

With this expression, the proposition is straightforward given restrictions on $\theta$ and $\sigma$.

## Online Appendix Table OA. 1 <br> Employment Response to Housing Demand Change and Manufacturing Decline: <br> Full Set of Estimated Coefficients

| Dependent Variable is Change in Employment Rate, 2000-2006 |  |  |  |  |  |

| $\begin{aligned} & \mathrm{N} \\ & \mathrm{R}^{2} \end{aligned}$ | 275 0.72 | 275 0.28 | 275 0.67 | 275 0.13 | 275 0.78 |
| Include baseline controls | y | y | y | y | y |

Notes: This table reports results of estimating equations (5) and (6) by OLS for various demographic groups. A 0.1 unit increase in the Housing Demand Change represents a 10 log point increase in housing demand, while a 0.01 unit decrease in Manufacturing Decline variable corresponds to a 1 percentage point decrease in predicted share of population employed in manufacturing. The baseline controls include the initial (year 2000) values of the share of employed workers with a college degree, the share of women in the labor force, and the log population in the MSA. The standardized effects rescale the coefficient by a one standard deviation change using the cross-MSA standard deviation. Standard errors, adjusted to allow for an arbitrary variance-covariance matrix for each state, are in parentheses and $p$-values are in brackets.

## Online Appendix Table OA. 2 First Stage for Housing Demand Change Using Magnitude of Structural Break in House Prices as Instrumental Variable

| Dependent variable: | Housing Demand Change, 2000-2006 |  | Change in Share of NonCollege Men Employed in Manufacturing, 2000-2006 |
| :---: | :---: | :---: | :---: |
|  | (1) | (2) | (3) |
| Magnitude of Structural Break in House Prices [Housing Boom Instrument] | 4.333 | 3.909 | 0.025 |
|  | $(0.814)$ | (0.734) | (0.020) |
|  | [0.000] | [0.000] | [0.207] |
| Predicted Manufacturing Decline |  | 13.790 | 1.202 |
|  |  | (3.989) | (0.080) |
|  |  | [0.001] | [0.000] |
| Standardized (1 $\sigma$ ) effects: |  |  |  |
| Change in housing demand instrument | 0.293 | 0.264 |  |
| Manufacturing decline |  | 0.111 |  |
| First-stage F-statistic | 28.34 | 28.36 |  |
| $\mathrm{R}^{2}$ | 0.60 | 0.64 | 0.40 |
| Include baseline controls | y | y | y |

Notes: $\mathrm{N}=275$ in all columns. This table reports results of estimating equation (6) by OLS. The baseline control variables included are initial (year 2000) values of the share of employed workers with a college degree, the share of women in labor force, and log population. The Magnitude of Structural Break in House Prices corresponds to the estimated MSA-specific magnitude of structural break in house price as estimated from 2000-2006 quarterly house price data (from FHFA), where the structural break is constrained to be between 2001-2005 (inclusive). The structural break procedure is carried out MSA-by-MSA by regressing (residualized) log house prices on a quadratic time trend and a structural break term, where the timing of the structural break is selected to maximize the $\mathrm{R}^{2}$ of the time-series regression. The standardized effects rescale the coefficient by a one standard deviation change using the cross-MSA standard deviation. Standard errors, adjusted to allow for an arbitrary variance-covariance matrix for each state, are in parentheses and p-values are in brackets.

## Online Appendix Table OA. 3 [IV Estimates of Table 2] Employment and Construction Employment Share Response to Housing Demand Change and Manufacturing Decline

|  |  |  |  |  | All |

| First stage F-statistic | 28.40 | 28.40 | 28.40 | 28.40 |
| Include baseline controls | y | y | y | y |

Notes: $\mathrm{N}=275$ in all columns. This table reports IV estimates analogous to columns (1) and (5) in Table 2 for alternative sample periods for dependent variable (but keeping right-hand side variables the same). See Table 2 for more details. The standardized effects rescale the coefficient by a one standard deviation change using the crossMSA standard deviation. Standard errors, adjusted to allow for an arbitrary variance-covariance matrix for each state, are in parentheses and p-values are in brackets.

## Online Appendix Table OA. 7 [IV Estimates of Table 7]

Decomposing Employment Responses into Non-participation and Unemployment

| Dependent variable: | Change in Employment, 2000-2006 |  | Change inNon-participation,$2000-2006$ |  | Change inUnemployment,$2000-2006$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Sample: | NonCollege Men (1) | All <br> Men and Women (2) | NonCollege Men (3) | All <br> Men and Women <br> (4) | NonCollege Men (5) | All <br> Men and Women (6) |
| Housing Demand Change | $\begin{gathered} 0.029 \\ (0.011) \\ {[0.005]} \end{gathered}$ | $\begin{gathered} 0.013 \\ (0.005) \\ {[0.005]} \end{gathered}$ | $\begin{aligned} & -0.014 \\ & (0.005) \\ & {[0.002]} \end{aligned}$ | $\begin{aligned} & -0.011 \\ & (0.003) \\ & {[0.000]} \end{aligned}$ | $\begin{aligned} & -0.015 \\ & (0.008) \\ & {[0.061]} \end{aligned}$ | $\begin{aligned} & -0.002 \\ & (0.003) \\ & {[0.527]} \end{aligned}$ |
| Manufacturing Decline | $\begin{aligned} & -0.499 \\ & (0.218) \\ & {[0.027]} \end{aligned}$ | $\begin{aligned} & -0.549 \\ & (0.119) \\ & {[0.000]} \end{aligned}$ | $\begin{gathered} 0.298 \\ (0.111) \\ {[0.010]} \end{gathered}$ | $\begin{gathered} 0.227 \\ (0.069) \\ {[0.002]} \end{gathered}$ | $\begin{gathered} 0.201 \\ (0.192) \\ {[0.301]} \end{gathered}$ | $\begin{gathered} 0.323 \\ (0.111) \\ {[0.006]} \end{gathered}$ |
| Standardized ( $1 \sigma$ ) effects: <br> Housing demand change <br> Manufacturing decline | $\begin{gathered} 0.017 \\ -0.005 \end{gathered}$ | $\begin{gathered} 0.007 \\ -0.006 \end{gathered}$ | $\begin{gathered} -0.008 \\ 0.003 \end{gathered}$ | -0.006 0.002 | -0.009 0.002 | -0.001 0.003 |
| First stage F-statistic | 28.397 | 28.397 | 28.397 | 28.397 | 28.397 | 28.397 |
| Include baseline controls | y | y | y | y | y | y |

Notes: $\mathrm{N}=275$ in all columns. This table reports IV estimates analogous to columns (1) and (5) in Table 2 for alternative dependent variables, allowing the overall employment effect to be decomposed into a change in unemployment rate and change in labor force participation rate. See Table 2 for more details. The standardized effects rescale the coefficient by a one standard deviation change using the cross-MSA standard deviation. Standard errors, adjusted to allow for an arbitrary variance-covariance matrix for each state, are in parentheses and p -values are in brackets.

## Online Appendix Table OA. 8 [IV Estimates of Table 8] <br> Wage and Population Response to Housing Demand Change and Manufacturing Decline

| Sample: | Non-College Men <br> (1) | College <br> Men <br> (2) | Non-College Women <br> (3) | College Women <br> (4) | All <br> Men and Women <br> (5) |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Dependent Variable is Change in Population, 2000-2006 |  |  |  |  |  |
| Housing Demand Change | $\begin{gathered} 0.051 \\ (0.069) \end{gathered}$ | $\begin{gathered} 0.056 \\ (0.033) \end{gathered}$ | $\begin{gathered} 0.045 \\ (0.065) \end{gathered}$ | $\begin{gathered} 0.063 \\ (0.031) \end{gathered}$ | $\begin{gathered} 0.053 \\ (0.055) \end{gathered}$ |
|  | [0.457] | [0.093] | [0.489] | [0.040] | [0.334] |
| Manufacturing Decline | $\begin{aligned} & -1.319 \\ & (0.759) \end{aligned}$ | $\begin{aligned} & -1.010 \\ & (0.713) \end{aligned}$ | $\begin{aligned} & -1.462 \\ & (0.794) \end{aligned}$ | $\begin{gathered} -0.838 \\ (0.755) \end{gathered}$ | $\begin{aligned} & -1.282 \\ & (0.718) \end{aligned}$ |
|  | [0.089] | [0.163] | [0.072] | [0.273] | [0.081] |
| Standardized (1 $\sigma$ ) effects: |  |  |  |  |  |
| Housing demand change | 0.029 | 0.032 | 0.026 | 0.036 | 0.030 |
| Manufacturing decline | -0.014 | -0.010 | -0.015 | -0.009 | -0.013 |
| First stage F-statistic | 28.40 | 28.40 | 28.40 | 28.40 | 28.40 |
| N | 275 | 275 | 275 | 275 | 275 |
| Include baseline controls | y | y | y | y | y |

Notes: This table reports results of estimating equations (5) and (6) by IV for various demographic groups. A 0.1 unit increase in the Predicted Housing Demand Change represents a 10 percent increase in housing demand, while a 0.1 unit change in Predicted Manufacturing Decline variable corresponds to a 10 percentage point change in predicted share of population employed in manufacturing. The baseline controls include the initial (year 2000) values of the share of employed workers with a college degree, the share of women in the labor force, and the log population in the MSA. The standardized effects rescale the coefficient by a one standard deviation change using the cross-MSA standard deviation. Standard errors, adjusted to allow for an arbitrary variance-covariance matrix for each state, are in parentheses and p-values are in brackets.

Online Appendix Figure OA.1: Lack of Correlation Between Structural Break Instrument and ..

Lagged Change in House Price Index, 1990-1995

Lagged House Price Index, 1990

Change in Two-Year Enrollment Per Capita, 1990-1995

Two-Year Enrollment Per Capita, 1990

Change in Four-Year Enrollment Per Capita, 1990-1995 Four-Year Enrollment Per Capita, 1990

Employment Rate, 1990

Average Wages, 1990

Notes: This figure reports the correlation between the structural break instrument used in the IV specifications and lagged levels and changes in house prices, emlpoyment rate, wages, and two-year and four-year college enrollment (per capita).

Online Appendix Figure OA.2: Significant Correlation Between Structural Break Instrument and ...

Notes: This figure reports the correlation between the structural break instrument used in the IV specifications and the growth in the price-rent ratio and the change in the share of "out-of-town" buyers, which can be interpreted as proxies for speculation. See text for details of the price-rent ratio calculation and the source of the "out of town" buyer share .
